1- Project Overview:

GlamBook is a web-based platform designed for customers to discover and book beauty services such as haircuts, makeup sessions, and spa treatments. Inspired by modern online booking experiences.

GlamBook simplifies the interaction between clients and beauty professionals. Our platform features user registration, service listings, appointment booking, and personalized profiles.

This project was developed as part of our Software Engineering coursework, following key software development principles and using the MVC (Model-View-Controller) design pattern. We utilized PHP, HTML, CSS, MySQL (via phpMyAdmin), and XAMPP for local development.

2- System Design:

- High-Level Architecture: MVC Style

- **Model**: PHP files interact with MySQL database
- **View**: HTML + CSS
- **Controller**: PHP scripts handle form submissions, sessions, and DB actions

- Database Tables:

- users – Stores registered users
- appointments – Stores bookings
- services – (optional/future) holds predefined service info

- Navigation Pages:

- Home – View services by category
- Booking – Submit appointment form
- Profile – View bookings, update info

3- Technologies Used:

- **Frontend**: HTML, CSS, Google Fonts, JavaScript
- **Backend**: PHP
- **Database**: MySQL (via phpMyAdmin)
- **Hosting**: Localhost (XAMPP)
- **Optional Tools**: Day.js (date handling), SweetAlert2 (popup)

4- Features Implemented:

- ✅ User Registration & Login
- ✅ Session Management
- ✅ Navigation Header Based on Login Status
- ✅ Browse Services by Category (Hair, Makeup, Spa)
- ✅ Booking Form with Date & Time
- ✅ Success Modal After Booking
- ✅ View Bookings on Profile Page
- ✅ Responsive Design

5- Summary for the Problems I found:

- Session Handling

One of the early issues encountered was improper session handling. Some pages didn't persist user login states because session_start() was missing or placed incorrectly. This was solved by ensuring every PHP file that accesses session data begins with session_start() before any HTML output.

- Database Connection Errors

There were frequent connection failures during initial testing. These were mostly caused by incorrect host or credential information. Ensuring MySQL was running and using the correct default login credentials (username: root, no password) resolved the issue.

-Booking Form Not Saving

The appointment booking form was not storing data in the database. The problem was traced to incorrect binding in the prepared SQL statement. After reviewing POST variables and using bind_param correctly, the booking feature started working properly.

6- Incomplete or Future Features:

- Admin panel for managing users and services
- Email/SMS notifications for appointment reminders
- Payment integration

Due to the short timeline and the individual nature of this project, I focused on core functionalities like registration, login, booking and add services. Admin panel and email notifications were deprioritized to ensure stability and functionality.

7- Conclusion:

The development of GlamBook has been a rewarding journey, showcasing the integration of front-end design, backend logic, and database connectivity to build a fully functioning appointment booking system. Throughout the project, I applied core software engineering principles—ranging from requirements analysis and system design to testing and debugging. Working individually allowed me to deeply understand each component and gain hands-on experience with technologies like PHP, MySQL, and HTML/CSS. Despite a few setbacks and limitations due to time constraints, the core functionalities were successfully implemented, and the application runs smoothly on local environments. GlamBook is a solid foundation that could be extended with more advanced features in the future, such as admin dashboards, real-time booking validation, and online payments. This project has significantly strengthened my web development skills and confidence in delivering full-stack solutions.
